Just like previous versions of Windows, the XP operating system can take an inordinately long time to startup each time you boot your PC. Luckily, there are a few minor changes that you can make to your system's set-up allowing you to significantly reduce this boot-up time. These tweaks are summarised in the following table:

| Tuning | Description |
|-----------------------------|------------------------------|
| Edit BOOT.INI file. | BOOT.INI contains |
| | important startup |
| | information. With 'TimeOut' |
| | you can reduce the |
| | 'TimeToWait' setting, thus |
| | reducing startup time. |
| Remove unwanted programs. | Check the Startup tab using |
| | the System Configuration |
| | utility 'MSCONFIG'. |
| Remove unwanted services. | Remove unwanted services |
| | according to the list in the |
| | 'Computer Management' |
| | window. |
| Uninstall the network card. | If you do not have a |
| | network connection, |
| | uninstall the network card |
| | or network adapter. |

Speed up the Startup Process with BOOT.INI

Each time Windows XP starts, it examines the BOOT.INI file as this contains information such as the startup parameters that are currently set-up. These can include the programs to automatically start and the Windows services to activate.

BOOT.INI is a text file. It can be opened with Notepad (or another standard text editor), by clicking **Start > Run** and entering the command: **notepad c:\boot.ini** followed by **Enter**).

Edit the BOOT.INI file for effortless and faster startup.

Open the BOOT.INI file.

If you don't have more than one operating system, reduce the wait time to '0' for a faster startup.

Read more about how you can tune Windows XP in article X 15.

Reduce the TimeToWait period

When Windows XP starts, a default period of 30 seconds is set in the Start menu. This is so that computers with more than one operating system installed on them have time to determine which operating system is to be loaded. If you have only one operating system installed, the set period is unnecessary. In this case, change the 'Time Out' in the BOOT.INI file to '0'.

Disable Windows XP startup screen

Windows XP shows you a number of different screens each time it starts up. You can disable the first startup screen that displays the Windows XP logo and go straight to your user account screen. Follow these steps to make the change:

- 1. Click **Start** > Right-click **My Computer** > choose **Properties** from the context menu that opens.
- 2. Click on the **Advanced** tab from the System Properties window that opens.
- 3. Click the **Settings** button under the Startup and Recovery heading.
- 4. Click the Edit button. You will see your Boot Loader file open in Notepad.
- 5. Add /sos to the end of the line that ends /fastdetect/
- 6. Click File > Save.
- 7. Close all open windows.
- 8. Re-boot your PC. You will no longer see the Windows XP logo screen on startup.

Edit your Boot Loader file for faster startup

If you intend to use the Norton Protected Recycle Bin you may experience problems if you make this change to the Boot Loader file. Visit the Symantec Knowledge Base for more information if you have or intend to install this Norton program on your computer at: <u>http://service4.symantec.com/</u> <u>support/nunt.nsf/pfdocs/199733115529</u>

Remove Unnecessary Software and Functions

Each time that you start Windows a number of programs are loaded automatically into memory. You can save some startup time by switching off any programs you don't need. You can do this via the Startup tab that you can see in the MSCONFIG utility.

| | | Location | Command | Startup Item |
|------------------|---|---|------------------------------------|-------------------------------|
| | | HKLM\SOFTWARE\Microsoft\Windows\CurrentVer. | RUNDLL32.EXE NvQT | RUNDLL 32 |
| Remove the 'tick | | HKLM\SOFTWARE\Microsoft\Windows\CurrentVer. | nwiz .exe /installquiet | ✓ nwiz |

Increase your startup speed by removing unwanted programs

Remove Unwanted Windows Services

When you installed Windows XP for the first time a set of tools were also installed. These are stand alone programs that can be removed if you don't require their features. These tools are also loaded when you boot XP, so removing them will reduce your startup time. Follow these steps to remove any unwanted Windows components:

Click Start > Control Panel > double-click Administrative Tools > double-click Computer Management.

In the directory tree on the left of the screen select the Services option. This is under the Service and Applications heading. This will open the general Services list. To remove or disable a service, double-click on its name and in the Startup type field use the drop-down menu to switch this to manual or disabled depending on your preference. The table below summarises the main services that you can either disable altogether, or start manually when you need them:

| Service | Description |
|------------------|--|
| Computer Browser | Maintains an updated list of computers on the network. If you are not on a network you can safely disable this. |
| Indexing Service | Indexes contents and properties of files. If you don't do a lot of searching for files on your computer, this service can be disabled. |

| Error Reporting Service | You can disable this as you already have the Event Log built into Windows XP. |
|-------------------------------------|--|
| IPSEC Services | Used to transfer encrypted files in the network. Again, if you are not on a network you can disable this service. |
| Messenger | Transmits service messages between clients and servers in the network. You can disable this service if you don't need this function. |
| Remote Access Connection Manager | If you don't need to access your computer from another location, this service can be switched off. |
| Server | Used to support file and print sharing over a network. If you are not on a network this service is not required. |
| TCP/IP NetBIOS Helper | Enables support for NetBIOS over the network and NetBIOS name resolution. These are further network services that can be disabled if not required. |
| Alerter | Notifies selected users and computers of administrative alerts. Only of use to network administrators. |

| Windows Time | Maintains date and time synchronization on all clients and servers in the network. Another network service you may not need. |
|--------------|--|
|--------------|--|

Uninstall Network Card

If your PC is not connected to a network or DSL (Digital Subscriber Line), you can uninstall the network card, or integrated network adapter. To do this, follow these steps:

- 1. Click Start > Control Panel > Double-click System > click on the Hardware tab > click the Device Manager button.
- 2. Right-click on the Network Adapter.
- 3. Click on Uninstall from the context menu that appears.

Your computer startup will now be faster because the network card is no longer connected and drivers do not have to be searched for.

Windows XP is Microsoft's most stable and feature rich operating system, but it still takes an inordinately long time to startup each time you switch on your computer. With the tips in this article you'll be able to disable features you don't want, and make changes to the startup procedure, that will ultimately make Windows XP start much faster.
